1.0 INTRODUCTION

This report presents the methodology, findings and conclusions of the Measure U Growth Management analysis prepared for the proposed Tennessee Street and Lugonia Avenue mixed-use development project. The project includes the construction of 460 multi-family residences and 17,764 square feet of retail space. The project site is located on the northeast corner of Tennessee Street and Lugonia Avenue in the City of Redlands (City), San Bernardino County.

1.1 Purpose of the Traffic Study and Study Objectives

This report is intended to satisfy the requirements for a traffic analysis established by the City of Redland's Growth Management Measure U. Measure U is a local growth management initiative adopted by Redlands and contains policies for traffic levels of service. Furthermore, level of service is no longer evaluated under the California Environmental Quality Act (CEQA) and is no longer included in CEQA environmental documents. CEQA now uses Vehicle Miles Traveled (VMT) as the metric for environmental traffic impacts. The City continues to use level of service analysis for purposes of evaluating a proposed project's compliance with the General Plan and Measure U. Therefore, this analysis includes a level of service analysis. A separate report will be submitted that contains the VMT analysis for the project. The study area, analysis scenarios, and analysis methodologies are based on the Measure U guidelines and in discussion with City staff.

1.2 Project Location & Study Area

The project is located on the northeast corner of Tennessee Street and Lugonia Avenue. The project proposes the construction of 460 multi-family dwelling units and 17,764 square feet of retail space.

Figure 1 shows the regional location of the project. The project opening year is 2024. Figure 2 illustrates the site plan of the proposed project. Based on the trip generation and trip distribution of the proposed project, and based on discussion with City staff, this report analyzes the following intersections for traffic operations:

Study Intersections

1. State Route 210 Eastbound Ramps and San Bernardino Avenue.
2. State Route 210 Westbound Ramps-Tennessee Street and San Bernardino Avenue.
3. Tennessee Street and Pennsylvania Avenue.
4. Tennessee Street and Driveway 1.
5. Tennessee Street and Lugonia Avenue.
6. Tennessee Street and Interstate 10 Westbound Ramps.
7. Tennessee Street and Interstate 10 Eastbound Ramps.
8. Tennessee Street and Colton Avenue.
9. Tennessee Street and Redlands Avenue.

The study area intersections are shown in Figure 3.

This report analyzes weekday daily, a.m. and p.m. peak hour conditions. The a.m. peak hour is defined as the one hour of highest traffic volumes occurring between 7:00 a.m. and 9:00 a.m. The p.m. peak hour is defined as the one hour of highest traffic volumes occurring between 4:00 and 6:00 p.m.

1.3 Analysis Scenarios

This report analyzes traffic operations for the following scenarios:

1. Existing Without Project Conditions.
2. Existing With Project Conditions.

2.0 PROJECT DESCRIPTION

The project proposes the construction of 460 multi-family dwelling units and 17,764 square feet of retail space. Access to the project will be provided by the Pennsylvania Avenue extension and one full-access driveway on Tennessee Street.

2.1 Project Trip Generation

Trip generation for the project is based on trip generation rates from the Institute of Transportation Engineers' (ITE) Trip Generation (11th Edition) for Land Use 220 "Multifamily Housing (Low-Rise)", Land Use 221 "Multifamily Housing (Mid-Rise)", and Land Use 822 "Strip Retail Plaza (<40k). The project includes a mix of retail and residential uses and therefore, will have trips that are internal to the project (e.g., a trip from the residential use to the retail use). Internal trips were calculated using the ITE internal capture methodologies. In addition, retail uses typically draw some of its trips from the adjacent street traffic. Such trips are not actually "new" trips from the project on the adjacent circulation system. These trips are referred to as "pass-by" trips. By definition, pass-by trips are trips that are on the roadway immediately adjacent to the project which make intermediate stops on the way from an origin to a primary trip destination without route diversion. Table A shows a summary of the project trip generation. As shown in Table A, after accounting for internal and pass-by trips, the project is anticipated to generate 195 net external trips during the a.m. peak hour, 245 net external trips during the p.m. peak hour, and 2,704 net external daily trips.

2.2 Project Trip Distribution & Assignment

Project trip distribution patterns for the proposed project were developed based on location of local/regional destinations and in consultation with City staff. Trip distributions were developed separately for residential and retail uses. Figures 4 and 5 illustrate the project trip distribution and the resulting project trips at the proposed study intersections for the residential uses. Figures 6 and 7 illustrate the project trip distribution and the resulting project trips at the proposed study intersections for the retail uses. The total net external trips are shown in Figure 8. The pass-by trip distribution and assignment are shown in Figures 9 and 10. The total net external with pass-by trips are shown in Figure 11.

3.0 LOS DEFINITIONS, PROCEDURES, AND THRESHOLDS

Level of service (LOS) is a measure of the quality of operational conditions within a traffic stream, and is generally expressed in terms of such measures as speed and travel time, freedom to maneuver, traffic interruptions, and comfort and convenience. Levels range from A to F, with LOS A representing excellent (free-flow) conditions and LOS F representing extreme congestion. Consistent with City guidelines, the Highway Capacity Manual (HCM) procedures have been used to evaluate levels of service. This section discusses the LOS definitions, procedures, and thresholds used in this report.

3.1 Intersection Levels of Service

The analysis of traffic operations at intersections was conducted according to the Highway Capacity Manual 6th Edition (HCM) delay methodologies using Synchro 11 software, which is described in the Highway Capacity Manual (Transportation Research Board, Washington, D.C., November 2016). Under the HCM methodology, LOS for signalized intersections is based on the average delay experienced by vehicles traveling through an intersection, whereas for un-signalized intersections, the LOS is based on the worst approach where the minor leg has a shared lane and on the worst movement where the minor leg has dedicated turn lanes. Table B presents a brief description of each level of service letter grade, as well as the range of delays associated with each grade.

3.2 Intersection Measure U Policy Requirements

The City's Measure U policy has established minimum target Levels of Services for study area intersections and roadways. The City LOS standards include the following:

- Maintain LOS C or better as the standard at all intersections presently at LOS C or better.

Table A - Project Trip Generation

Land Use	Units	A.M. Peak Hour			P.M. Peak Hour			Daily
		In	Out	Total	In	Out	Total

Pass By Rate ^A				40%			40%	40%
Pass By Trips		(8)	(9)	(17)	(21)	(22)	(43)	(352)
Net After Pass-By		17	8	25	34	31	65	529
Total Net Trip Generation		56	139	195	145	100	245	2,704

¹ Trip generation based on rates for Land Use 220 - "Multifamily Housing (Low-Rise)" from Institute of Transportation Engineers' (ITE) Trip Generation (11th Edition).

² Trip generation based on rates for Land Use 221 - "Multifamily Housing (Mid-Rise)" from Institute of Transportation Engineers' (ITE) Trip Generation (11th Edition).

³ Trip generation based on rates for Land Use 822 - "Strip Retail Plaza(<40k)" from Institute of Transportation Engineers' (ITE) Trip Generation (11th Edition).

^A Daily Pass-by rates for Land Use 822 (Strip Retail Plaza) are based on pass-by rates for Land Use 821 (Shopping Plaza) from ITE Trip Generation (11th Edition). Rates for a.m.peak hour and daily are assumed to be same as p.m. peak hour rate.

Table B: Intersection Level of Service Criteria

LOS	Description of Drivers' Perception and Traffic Operation	Intersection Delay in Seconds	
		Unsignalized	Signalized
A	This level is typically assigned when the volume-to-capacity ratio is low and either progression is exceptionally favorable, or the cycle length is very short. If it is due to favorable progression, most vehicles arrive during the green indication and travel through the intersection without stopping.	≤ 10	≤ 10
B	This level is assigned when the volume-to-capacity ratio is low and either progression is highly favorable, or the cycle length is short. More vehicles stop than with LOS A.	> 10 and ≤ 15	> 10 and ≤ 20
C	This level is typically assigned when progression is favorable, or the cycle length is moderate. Individual cycle failures (i.e., one or more queued vehicles are not able to depart as a result of insufficient capacity during the cycle) may begin to appear at this level. The number of vehicles stopping is significant, although many vehicles still pass through the intersection without stopping.	> 15 and ≤ 25	> 20 and ≤ 35
D	This level is typically assigned when the volume-to-capacity ratio is high and either progression is ineffective, or the cycle length is long. Many vehicles stop and individual cycle failures are noticeable.	> 25 and ≤ 35	> 35 and ≤ 55
E	This level is typically assigned when the volume-to-capacity ratio is high, progression is unfavorable, and the cycle length is long. Individual cycle failures are frequent.	> 35 and ≤ 50	> 55 and ≤ 80
F	This level is typically assigned when the volume-to-capacity ratio is very high, progression is very poor, and the cycle length is long. Most cycles fail to clear the queue.	> 50	> 80

- Where the current LOS at a location within the City is below the LOS standard C, no development project shall be approved that cannot be mitigated so that it does not reduce the existing LOS at that location.

Caltrans maintains LOS D as the minimum level of service for state facilities. Therefore, a deficiency at an intersection occurs when the LOS falls below LOS C for the City and LOS D for Caltrans.

4.0 VOLUME DEVELOPMENT METHODOLOGY

Forecast traffic volumes at study intersections were developed consistent with the City's guidelines. This section discusses the volume development methodology used to forecast future traffic volumes.

4.1 Existing Conditions Traffic Volumes

Existing traffic volumes for intersections and roadway segments are based on peak hour intersection turn movement counts and daily counts collected by Counts Unlimited in May 2022. Vehicle classification counts (e.g., passenger vehicle, 2-axle truck, 3-axle truck, and 4 or more axle truck), were conducted at all study area intersections. Consistent with City guidelines, PCE volumes at these intersections were computed using a PCE factor of 1.5 for 2-axle, 2.0 for 3-axle, and 4.0 for 4-axle trucks. Count sheets are contained in Appendix A. Detailed volume development worksheets are included in Appendix B.

4.2 Existing With Project Traffic Volumes

Traffic volumes for existing with project conditions were developed by adding the trip assignment to the existing without project peak hour traffic volumes.

5.0 EXISTING CONDITIONS

This section discusses the existing transportation conditions in the study area.

5.1 Existing Roadway Conditions

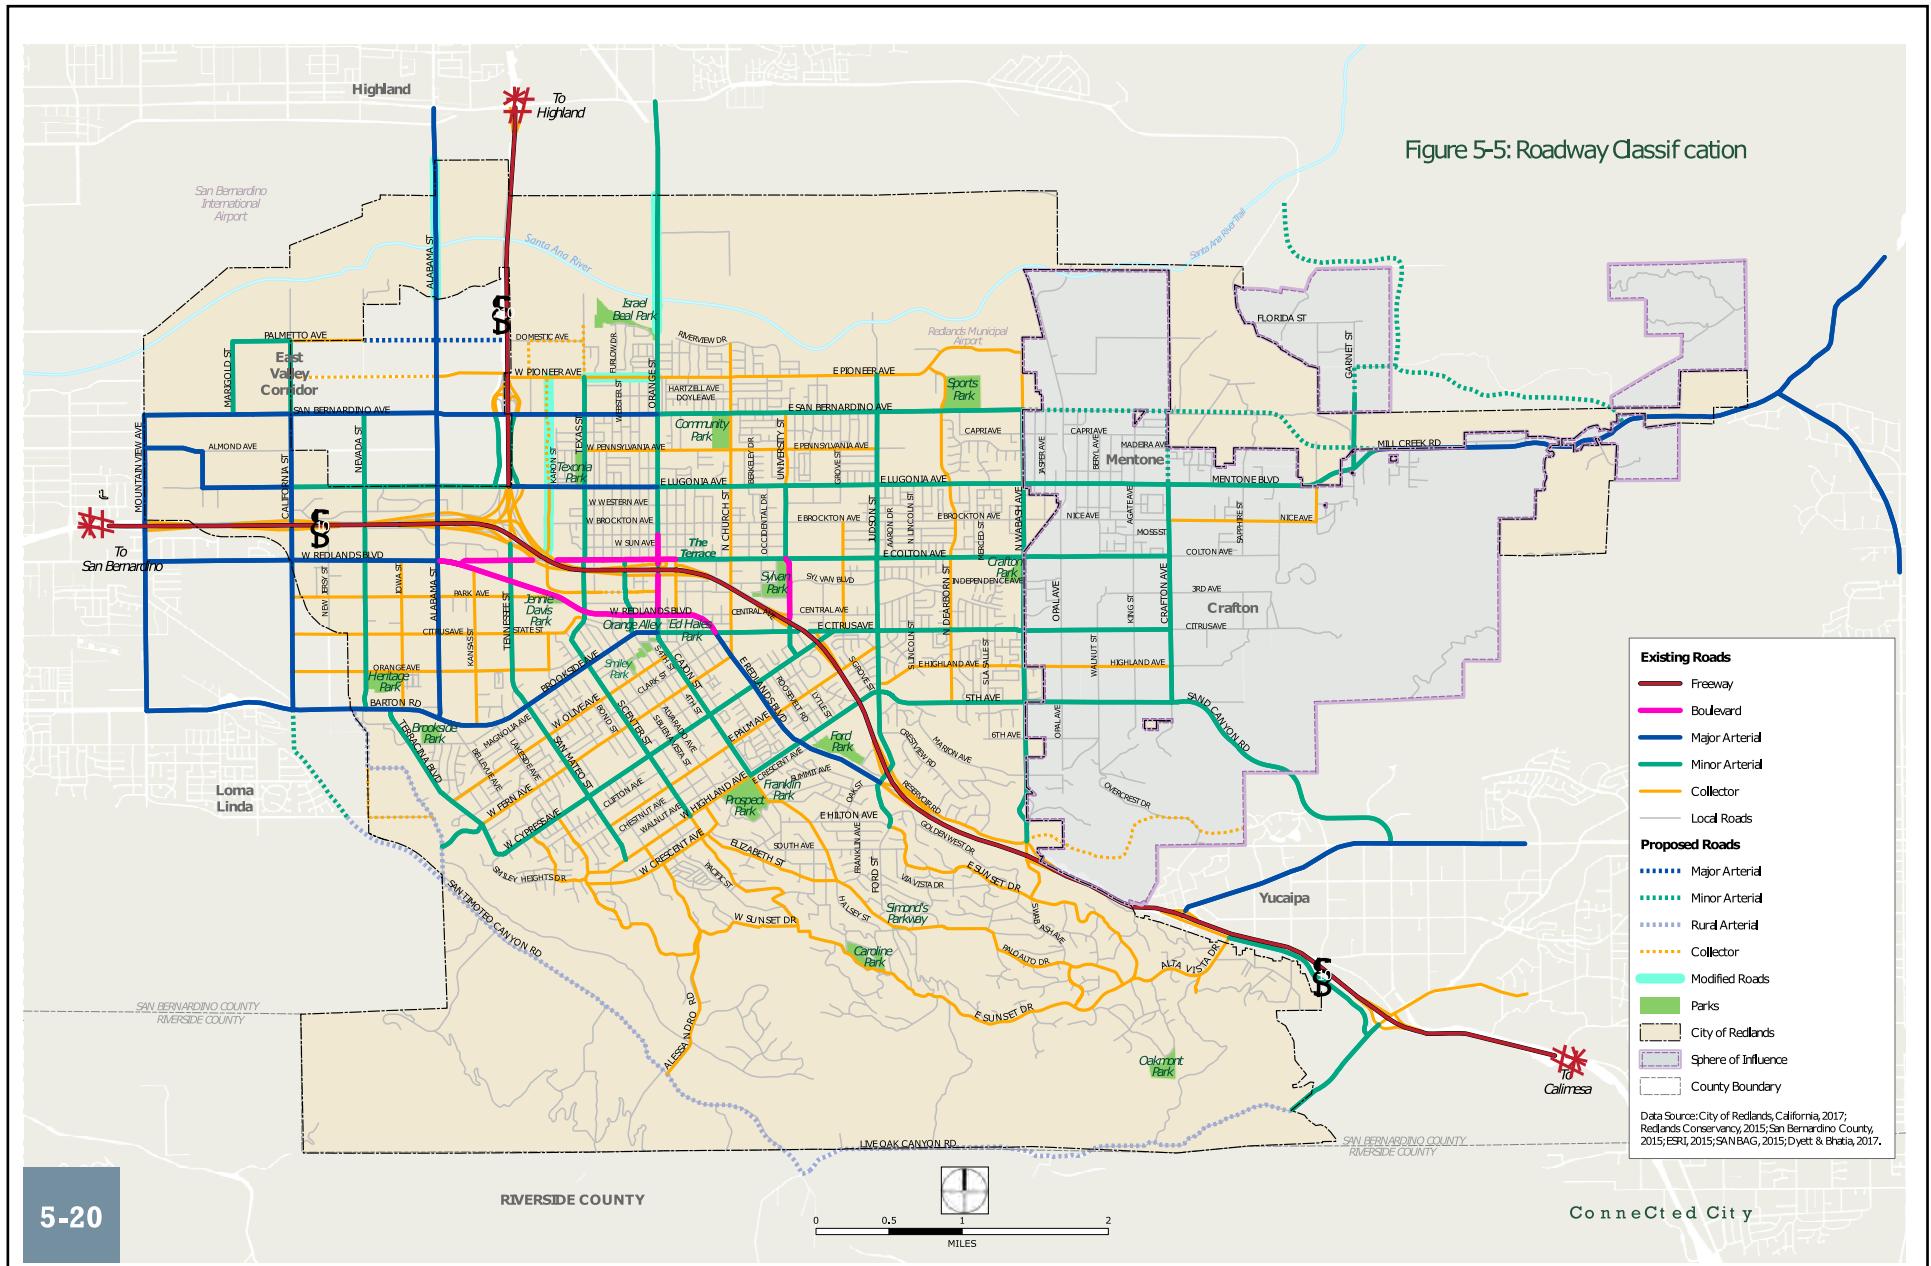

Regional access to the project site is provided by SR-60 to the north. Local access to the project will be provided by the following roadways:

- **San Bernardino Avenue** is oriented in the east-west direction and is a 5-lane roadway from east of Alabama Street to State Route 210 Eastbound Ramps. The City's circulation element designates San Bernardino Avenue as a "Major Arterial". The speed limit on San Bernardino Avenue is 45 miles per hour. On-street parking is prohibited.
- **Tennessee Street** is oriented in the north-south direction and is a 2-lane roadway from San Bernardino Avenue and Lugonia Avenue. The City's circulation element designates Tennessee Street as a "Minor Arterial" roadway. The speed limit on Tennessee Street is 40 miles per hour. On-street parking is prohibited.
- **Lugonia Avenue** is oriented in the east-west direction and is a 3 to 4-lane roadway within the project study area. The City's circulation element designates Lugonia Avenue as a "Major Arterial" roadway. The speed limit on Lugonia Avenue is 35 miles per hour. On-street parking is prohibited.
- **Colton Avenue** is oriented in the east-west direction and is a 4-lane roadway within the project study area. The City's circulation element designates Colton Avenue as a "Boulevard" roadway. The speed limit on Colton Avenue is 35 miles per hour. On-street parking is prohibited.
- **Redlands Boulevard** is oriented in the south-east direction and is a 4-lane roadway within the project study area. The City's circulation element designates Redlands Boulevard as a "Boulevard" roadway. The speed limit on Redlands Boulevard is 40 miles per hour. On-street parking is prohibited.

The City's roadway classification system of roadways, including freeways and arterial streets are shown in Figure 12.

5.2 Existing Transit Service

Public transportation services within the project area includes bus transit service provided by the Omnitrans. This service is further described below.

Source: Redlands General Plan

Tennessee Street and Lugonia Avenue Mixed-Use
City of Redlands' Roadway Classifications

Bus Service. Public transportation within the project area is provided by Omnitrans, which is the regional transit operator in San Bernardino County.

- **Route 15** provides transit service on Lugonia Avenue, Alabama Street, and San Bernardino Avenue within the project area. Route 15 has a major stop at San Bernardino Avenue and Orchard Way. Route 15 operates at 60-minute headways on weekdays.

Figure 13 illustrates the existing transit services. As shown in Figure 13, the closest transit route to the project is located on Lugonia Avenue and San Bernardino Avenue via Route 15.

5.3 Existing Pedestrian & Bicycle Facilities

The City uses several types of bike path classifications and are discussed below:

- **Class I Bikeways (Bike Paths):** Class I bikeways are completely separate facilities designated for the exclusive use of bicyclists and pedestrians with minimal vehicle crossings.
- **Class II Bikeways (Bike Lanes):** Class II bikeways are striped lanes designated for the use of bicycles on a street or highway. Vehicle parking and vehicle/pedestrian crossflow are permitted at designated locations.
- **Class III Bikeways (Bike Routes):** Class III bikeways are routes designated by signs or pavement markings such as sharrows for bicyclists within the vehicular travel lane (i.e., share use) of a roadway.
- **Class IV Bikeways (Cycletracks):** Class IV Bikeways are protected bike lanes, which provide a right-of-way designated exclusively for bicycle travel within a roadway, protected from vehicular traffic with devices such as curbs, flexible posts, inflexible physical barriers, or on-street parking.
- **Bicycle Boulevards:** Bicycle Boulevards are low-volume and low-speed streets that prioritize bicycles. Bicycle travel on these boulevards is optimized through traffic calming devices such as speed humps and high visibility crosswalks.

Figure 14 illustrates the existing bikeways within the City. As shown in Figure 14, there are no existing bike lanes on Tennessee Street, Lugonia Avenue, or San Bernardino Avenue. Pedestrian circulation within the City is primarily provided via sidewalks. The existing pedestrian sidewalks adjacent to the project are illustrated in Figure 15. As illustrated in Figure 15, there are no existing sidewalks on Tennessee Street or on the northern leg of Tennessee Street and Lugonia Avenue adjacent to the project site.

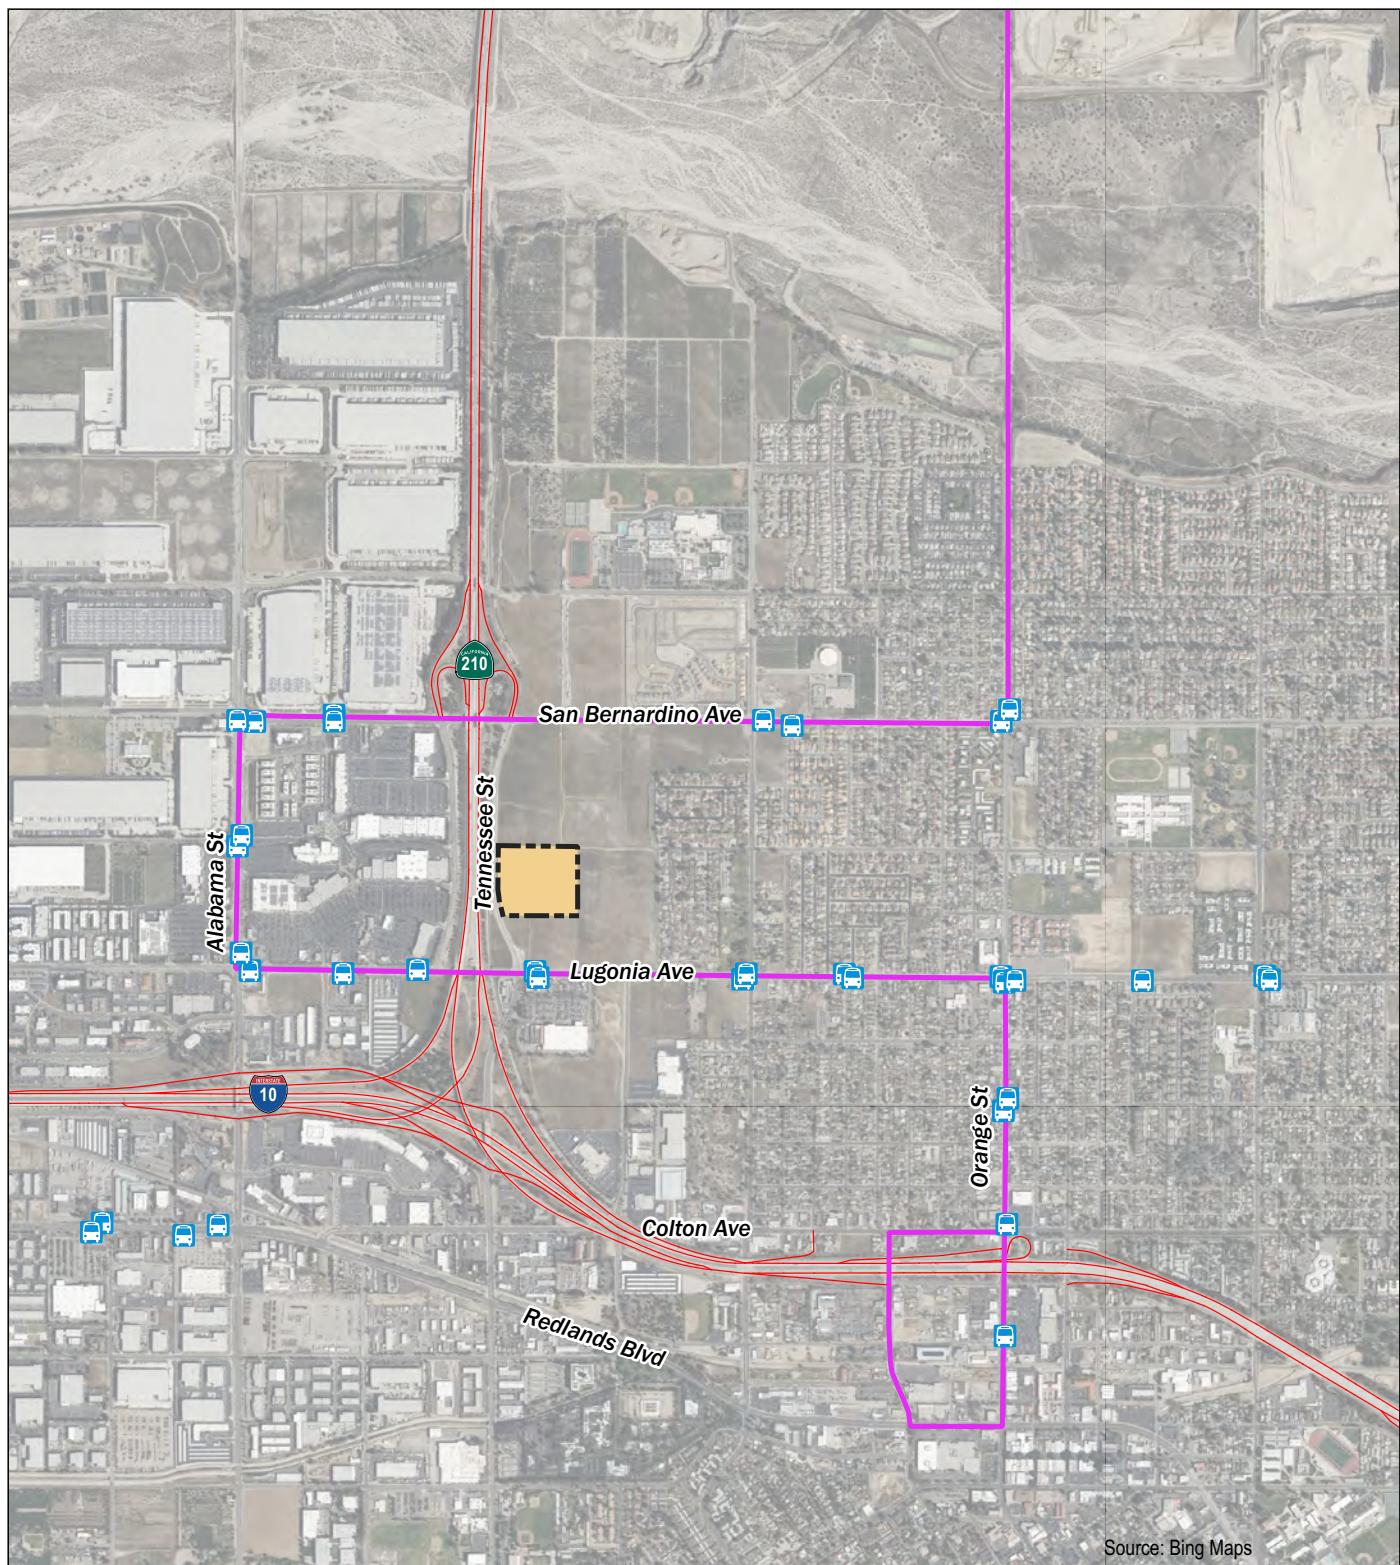

5.4 Existing Without Project Intersections Levels of Service

An intersection level of service analysis was conducted for existing without project conditions to determine current circulation system performance. Figure 16 shows the existing without project lane geometrics and stop controls at the study intersections. The existing without project traffic volumes at study intersections are illustrated in Figure 17. Detailed volume development worksheets are included in Appendix B. The existing without project levels of service for the study area intersections are summarized in Table C. Level of service calculation worksheets are contained in Appendix C. As shown in Table C, all study area intersections are currently operating at satisfactory levels of service with the exception of the following:

- Tennessee Street and Lugonia (a.m. and p.m. peak hours).
- Tennessee Street and Redlands Boulevard (a.m. and p.m. peak hours).

5.5 Existing With Project Intersections Levels of Service

An intersection level of service analysis was conducted for existing with project conditions to determine the forecast circulation system performance. The existing with project traffic volumes at study intersections are illustrated in Figure 18. Detailed volume development worksheets are included in Appendix B. The existing with project levels of service for the study area intersections are summarized in Table C. Level of service calculation worksheets are contained in Appendix C. As shown in Table C, all study area intersections are forecast to operate at satisfactory levels of service with the exception of the following:

FIGURE 18

XXX / YYY AM / PM Peak Hour Volume (In PCEs)

Tennessee Street and Lugonia Avenue Mixed-Use Existing With Project Peak Hour Traffic Volumes (PCEs)

- Tennessee Street and Lugonia Avenue (a.m. and p.m. peak hours).
- Tennessee Street and Redlands Boulevard (a.m. and p.m. peak hours).

Based on Measure U guidelines, where the current LOS at a location within the City is below the LOS standard C, no development project shall be approved that cannot be mitigated so that it does not reduce the existing LOS at that location. Table C shows that the intersection of Tennessee Street and Redlands Boulevard operates at unsatisfactory LOS D under without and with project conditions. The project does not increase the intersection delay under the a.m. or p.m. peak hours. Therefore, no improvements have been recommended at this location.

6.0 CIRCULATION IMPROVEMENTS

The City requires that circulation improvements be recommended if the study area intersections don't meet the City's Measure U guidelines. Under existing with project conditions, the following circulation improvements are recommended as follows:

- Tennessee Street and Lugonia Avenue: Optimize the signal cycle length.

The resulting levels of service for existing with project with improvements conditions are included in Table D. As shown in Table D, with the addition of the improvements, the intersection delay for Tennessee Street and Lugonia Avenue is reduced to pre-project conditions.

7.0 INGRESS/EGRESS ANALYSIS

An ingress/egress analysis was conducted at the new intersection of Pennsylvania Avenue Extension and Tennessee Street and the project driveway to determine if inbound/outbound traffic would cause significant queues to back-up on Tennessee Street or Pennsylvania Avenue. Table E shows the existing with project queues at the intersections of Tennessee Street and Pennsylvania Avenue extension and Tennessee Street and Driveway 1. As shown in Table E, the southbound through-left-turn inbound movement at Tennessee Street and Pennsylvania Avenue and Tennessee Street and Driveway 1 does not exceed more than one vehicle. It is not anticipated that queues would back-up on Tennessee Street and cause significant delays on Tennessee Street. In addition, the westbound left-right turn lane on Pennsylvania Avenue would not exceed more than one vehicle. It is not anticipated that queues on Pennsylvania Avenue Extension would back-up and cause significant delays.

8.0 SUMMARY & CONCLUSIONS

The proposed project is forecast to generate 195 net external trips during the a.m. peak hour, 245 net external trips during the p.m. peak hour, and 2,704 net external daily trips. Based on the LOS analysis, all study area intersections are forecast to operate at satisfactory levels of service with the exception of Tennessee Street and Lugonia Avenue and Tennessee Street and Redlands Avenue in the a.m. and p.m. peak hours under existing without and with project conditions. With the addition of the circulation improvements, the intersection delay for Tennessee Street and Lugonia Avenue is reduced to pre-project conditions.

An ingress/egress analysis at the intersections of Tennessee Street and Pennsylvania Avenue extension and the project driveway on Tennessee Street shows that the southbound through-left-turn inbound movement at Tennessee Street and Pennsylvania Avenue and Tennessee Street and Driveway 1 does not exceed more than one vehicle. It is not anticipated that queues would back-up on Tennessee Street and cause significant delays on Tennessee Street. In addition, the westbound left-right turn lane on Pennsylvania Avenue would not exceed more than one vehicle. It is not anticipated that queues on Pennsylvania Avenue Extension would back-up and cause significant delays.

Table D: Existing With Project With Improvements Levels of Service

Intersection	Jurisdiction	LOS Standard	Control	Without Project		With Project With Improvement	
				AM Peak Hour		PM Peak Hour	
				Delay	LOS	Delay	LOS
5 . Tennessee St/Lugonia Ave	Redlands	C	Signal	43.5	D *	53.7	D *
						39.8	D *
						50.6	D *

Notes:

LOS = Level of Service

Table E: Existing With Project Queueing Analysis

Intersection	Movement	Storage Length (In Feet)	Existing With Project	
			AM Peak Hour	PM Peak Hour
			Queue Length ¹	Queue Length ¹
3 . Tennessee St/Pennsylvania Ave	SBTL	1200	0	0
	WBLR	775	25	25
4 . Tennessee St/Dwy 1	SBTL	365	25	25
	WBLR	175	50	50

Notes:

¹Queues reported are 95th Percentile queue lengths per movement in feet. 25 Feet per vehicle is assumed.
